- For multicluster application management technologies, ArgoCD and Cilium were considered technologies ready to 'adopt'. [→](#)
- Cilium was considered the most mature and useful technology of this group. [→](#)
- ArgoCD was also considered highly useful, but ranked lower on the maturity rankings, but was the multicluster application management technology that received the highest proportion of developers who would recommend the technology. [→](#)
- For Batch/AI/ML computing technologies, Apache Airflow, CubeFS, Kubeflow, and Fluid were placed in the 'adopt' position of the technology radar. [→](#)
- Apache Airflow, CubeFS, and Kubeflow were the top three ranked technologies for usefulness and maturity. [→](#)
- Fluid ranked highly on maturity, and was one of the most likely technologies developers stated they would recommend to others. [→](#)

INTRODUCTION

01

1. Introduction

In Q3 2024, more than 300 professional developers using technologies associated with cloud-native development were asked about their experience and opinions with regard to batch computing and multicloud application management technologies.¹ The developers originate from around the world, and have a large range of specialities and areas of focus. A more granular breakdown of the respondents is included in the Methodology section.

For the products or tools they were familiar with, they rated them on their usefulness and maturity and indicated how likely they were to recommend that technology to other developers. Within the context of this report, usefulness was defined as how well it meets project requirements, and maturity related to a technologies' stability and reliability. The recommendation scale was converted into a net promoter score (NPS) for use during the analysis.

¹ More information on these technologies can be found at [the CNCF Landscape](#) and [LF AI & Data Landscape](#).

Based on the usage, usefulness and maturity ratings, and how likely they are to recommend a given technology, we categorised the technologies into four groups: adopt, trial, assess, and hold. 'Adopt' technologies are considered reliable choices for most use cases, while 'trial' technologies are worth exploring to see if they meet your specific needs. 'Assess' technologies require careful evaluation before committing, and 'hold' technologies are considered less mature or useful in their current state.

Note: These groups do not necessarily correlate with the CNCF maturity model (Sandbox, Incubating, and Graduated) which corresponds to the Innovators, Early Adopters, and Early Majority tiers from Geoffrey A. Moore's *Crossing the Chasm: Marketing and Selling High-Tech Products to Mainstream Customers*.

Sandbox: Sandbox projects are in their earliest stages, meant for experimentation and foundational growth. They represent initial concepts and technology with significant room for evolution.

Incubating: Projects that have a solidified technical vision and growing contributor base but are still maturing in terms of community adoption, stability, and governance.

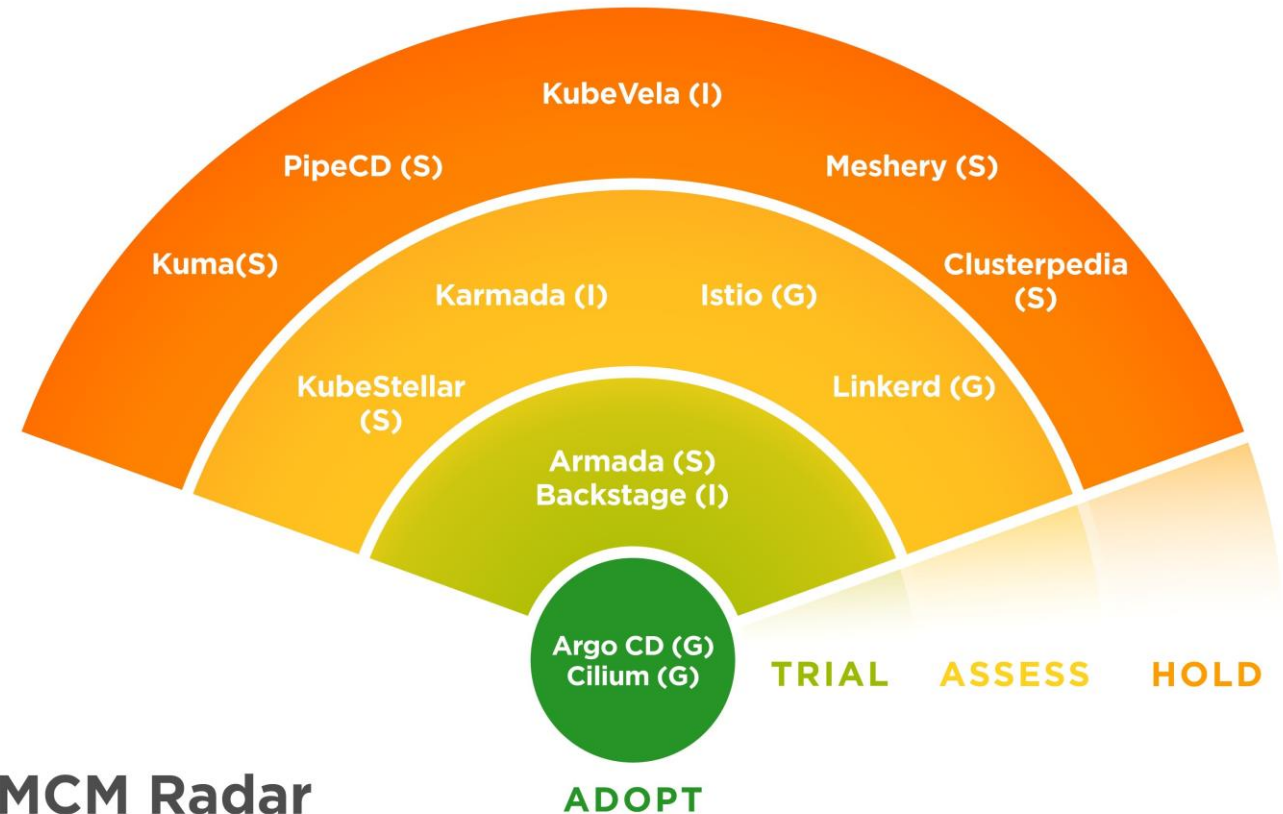

Graduated: Graduated projects are widely adopted and reliable. They have established a diverse community base supported by mature technical policies and governance.

TRENDS IN DEVOPS TECHNOLOGY USAGE

Q2

2. Multicluster Application Management Technologies

For multicluster application management (MCM) technologies, we see Argo CD and Cilium emerged as the two MCM technologies that respondents cumulatively would place in the “adopt” position of the technology radar.

2. Multicluster Application Management Technologies

Cilium received the highest usefulness score (+50), as well as receiving no negative, 1 or 2 star, ratings. Armada and Clusterpedia received very few negative ratings (2%, each), but a much smaller proportion of 5-star ratings (35% and 27%, respectively), suggesting that while developers don't consider them poorly matched to project requirements, they are not yet excelling, likely as a consequence of both being relatively new technologies in the sandbox stage.

85%

**THE PROPORTION OF 4 AND 5-STAR
USEFULNESS RATINGS FOR ARGOCD**

2. Multicloud Application Management Technologies

Usefulness ratings of multicloud application management technologies

Question wording: How would you rate the following multicloud management tools/products with respect to these aspects (Usefulness)
 % of developers familiar with each technology | Score (% of 5 star ratings minus the % of 1 and 2 star ratings) (n=204)

2. Multicluster Application Management Technologies

Cilium also received the highest maturity score (+47), cementing its position as a technology that the community considers both the most useful and mature. Despite its worse usefulness ratings and likelihood of recommendation, Linkerd receives high ratings for its maturity. As a project that has graduated from CNCF's project stages, this is a positive positioning. While not all technologies will meet the needs of all developer's projects, high levels of stability and reliability are key to ensuring a smooth baseline performance of a tool.

Half of developers asked gave Cilium a 5-star rating for maturity

2. Multicloud Application Management Technologies

Maturity ratings of multicloud application management technologies

Question wording: How would you rate the following multicloud management tools/products with respect to these aspect (Maturity)
 % of developers familiar with each technology | Score (% of 5 star ratings minus the % of 1 and 2 star ratings) (n=204)

2. Multicluster Application Management Technologies

Argo CD received the highest NPS, +87, which also corresponds to it being the most widely used MCM technology within our survey. Armada has the second-highest NPS, +79, which likely emerges from the high maturity ratings it received. During the personal usage of technologies, developers may be more likely to consider recommending a technology that is reliable, over one that can meet all the requirements of their projects. Downtime or failures may be viewed as a greater pain point than a tool overall being ideally matched to a project's requirements.

Despite this, Cilium receives a lower NPS (+70) than would be expected of its high usefulness and maturity ratings. This suggests there may be additional considerations that developers place on these technologies, before recommending them, that are not captured by our current research, and may benefit from further investigation.

**OF CURRENT OR FORMER USERS OF
MESHERY WOULD RECOMMEND IT TO
OTHERS**

2. Multicloud Application Management Technologies

Likelihood to recommend multicloud application management technologies

Question wording: How likely are you to recommend the following multicloud management technologies?

% of developers with experience with each technology | NPS (% of Likely and Very likely minus the % of Unlikely and Very unlikely) (n=204)

2. Multicenter Application Management Technologies

By using a normalised scale for each aspect of the technology considered for projecting their position on the technology radar, we can see the overall positioning of technologies by their radar position. In general, technologies in the adopt or trial position are more likely to receive higher normalised scores for each aspect, while those in the hold position receive lower scores.

However, it is possible to see technologies in the “assess” position performing well in some aspects, but in others, they performed worse, leading to their overall position. The technology radar positions are determined by their position across all factors, meaning that sporadic strong performance on one feature is not enough to move technology into the “adopt” position-banding.

2. Multicloud Application Management Technologies

Distribution of normalised scores for MCM technologies

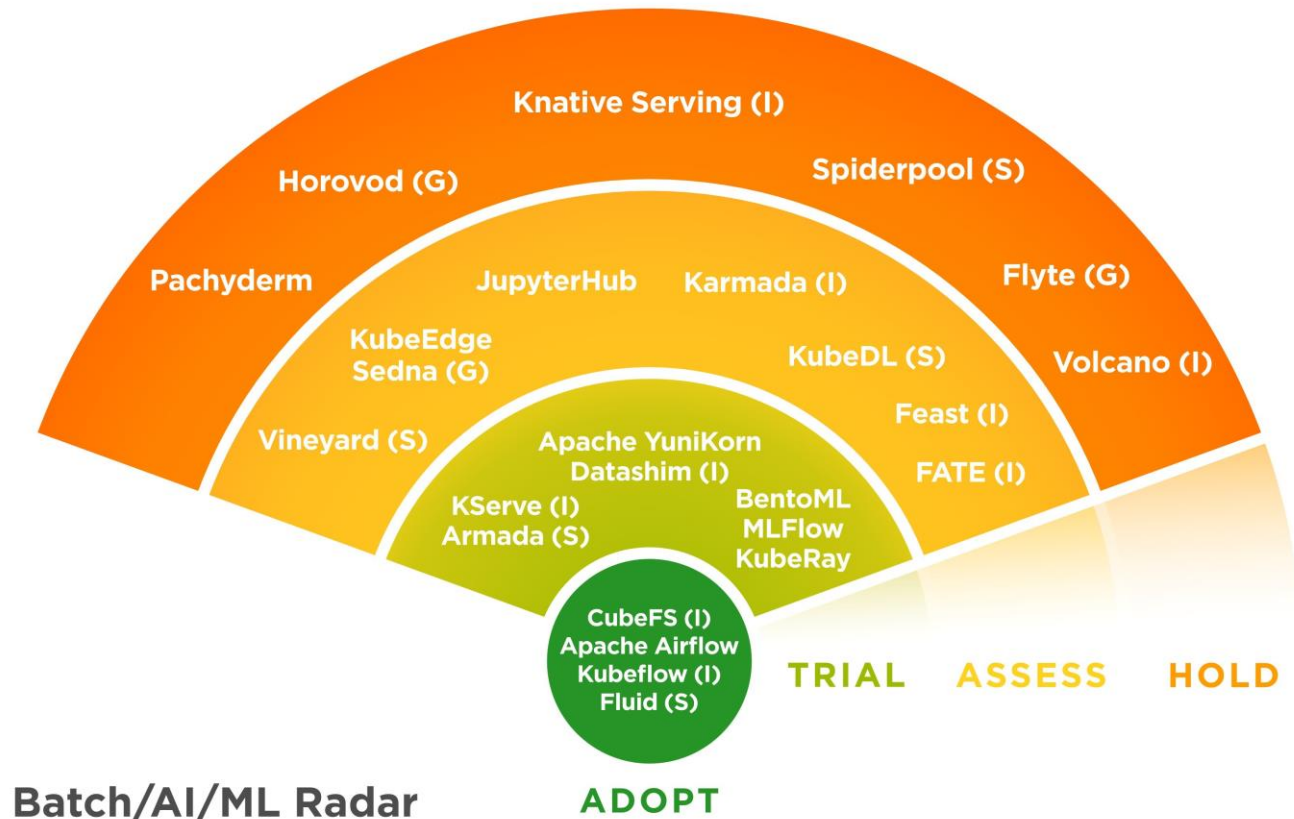

BATCH/AI/ML COMPUTE TECHNOLOGIES

03

3. Batch/AI/ML Compute Technologies

Moving from multicluster application management technologies, we now look at batch/AI/ML compute technologies. Across all of the batch/AI/ML compute technologies developers were asked about, Apache Airflow was a clear standout. The most popular technology, with the highest maturity rating, and the second highest usefulness rating and NPS.

(n=217)

Based on developer perceptions: 'Adopt' technologies are considered reliable choices for most use cases, 'trial' technologies are worth exploring to see if they meet your specific needs, 'assess' technologies require careful evaluation before committing, and 'hold' technologies are considered less mature or useful in their current state.

* Graduated, Incubating, and Sandbox refer to [CNCF](#) and [LF AI & Data's hosted projects](#) levels

3. Batch/AI/ML Compute Technologies

Kubeflow received the highest usefulness score (+47), but Apache Airflow (+40) received more four and five-star reviews. CubeFS (+40), Fluid (+36), and Kubeflow¹ achieved usefulness scores that placed them in the top five technologies, despite still being in either CNCF's sandbox or incubating stage of project maturity, indicating a promising future for these technologies. Spiderpool received a larger proportion of 5-star ratings (34%) than technologies with similar usefulness scores, such as JupyterHub and Pachyderm, due to the higher proportion of 1 and 2-star ratings (20%). This suggests that for some developers Spiderpool is meeting their project requirements very well, but these may be more niche or less common use cases.

¹ Kubeflow has multiple projects within it, such as ArgoCD and Kueue, that are largely invisible to the user but are a component of the developer experience of using it

85% of MLFlow's ratings for usefulness were positive, but only 35% of them were 5-stars

3. Batch/AI/ML Compute Technologies

Usefulness ratings of Batch/AI/ML technologies

Question wording: How would you rate the following batch, AI, or ML computing products/tools with respect to these aspects? (Usefulness)
 % of developers familiar with each technology | Score (% of 5 star ratings minus the % of 1 and 2 star ratings) (n=217)

3. Batch/AI/ML Compute Technologies

A staggering 88% of developers asked about Apache Airflow gave it either a 4 or 5-star rating for its maturity, with the majority of developers (58%) giving a 5-star rating. Only Apache Unicorn receives a similar amount of overall positive ratings, but a much smaller percentage (32%) of 5-star ratings. KServe received a large percentage of negative ratings on its maturity (16%), indicating an important area where developers feel it is falling short.

45%

**OF DEVELOPERS FAMILIAR WITH
CUBEFS GAVE IT A 5-STAR RATING ON
MATURITY**

3. Batch/AI/ML Compute Technologies

Maturity ratings of Batch/AI/ML technologies

Question wording: How would you rate the following batch, AI, or ML computing products/tools with respect to these aspects? (Maturity)
 % of developers familiar with each technology | Score (% of 5 star ratings minus the % of 1 and 2 star ratings) (n=217)

3. Batch/AI/ML Compute Technologies

Developers who indicated they had used a technology were asked how likely they were to recommend it to other developers. Despite the various ratings for maturity and usefulness, a clear majority of users of each technology recommend them. Vineyard received the fewest users who would recommend it, but this still constituted 66% of users surveyed. This, overall, makes recommendations a less effective metric in isolation for differentiating technologies. In general, developers provide favourable recommendations to the technologies they have invested time and energy in learning to use, reminding us of the importance of digging further into developer perceptions of technologies when constructing technology landscape radars.

Developers provide high overall recommendation ratings for tools they are familiar with. Vineyard received the fewest recommendations, but was still a majority among current or former users (66%)

3. Batch/AI/ML Compute Technologies

Likelihood to recommend Batch/AI/ML technologies

Question wording: How likely are you to recommend the following batch, AI, or ML computing technologies?

% of developers with experience with each technology | NPS (% of Likely and Very likely minus the % of Unlikely and Very unlikely) (n=217)

3. Batch/AI/ML Compute Technologies

METHODOLOGY

Methodology

Over two weeks between September and October 2024, more than 300 professional developers using cloud native technologies were asked for their opinions on various batch computing and multicloud application management technologies they were familiar with. Multicloud application management and batch/AI/ML compute technologies were identified by CNCF as two technology areas to investigate further for this technology landscape radar. The individual technologies selected are based on those identified by CNCF's End User Technical Advisory Board (TAB).

From the developer responses four variables were derived:

- **Weighted usage score:** Using the proportion of developers familiar with a technology, longer-term usage was weighted higher than more recent adoption, indicating long-term viability and continued use of a technology
- **Maturity score:** Developers were asked to rate technologies on a 5-star scale of maturity, where 1 star indicated low maturity and 5 stars indicated high maturity. The maturity score for each technology was calculated as the percentage of 5-star ratings minus the percentage of 1- and 2-star ratings, multiplied by 100 to create a scale of -100 to 100.

Methodology

- **Usefulness score:** Developers were asked to rate technologies on a 5-star scale of usefulness, where 1 star indicated low usefulness and 5 stars indicated high usefulness. The usefulness score for each technology was calculated as the percentage of 5-star ratings minus the percentage of 1- and 2-star ratings, multiplied by 100 to create a scale of -100 to 100.
- **Net Promoter Score (NPS):** Developers were asked to state how likely they were to recommend the technology, on a scale of highly likely, likely, neutral, unlikely, highly unlikely. This was converted to an NPS by taking the percentage of likely and highly likely and subtracting the percentage of unlikely and highly unlikely. This was multiplied by 100 to create a scale of -100 to 100.

All four variables were normalised to a scale of 0 to 1, after which multidimensional scaling (MDS) was used to visualise the levels of similarity and difference between each of the technologies. MDS was chosen to provide a proximity-based analysis to identify similarly performing technologies. The results of this MDS analysis was then clustered into four distinct groups to provide the adopt, trial, assess, and hold bands of the technology radar.

Subjective nature of Likert scales

In our research, we employed Likert scales to capture developers' opinions on the maturity and usefulness, from 1 to 5-stars, of the various multicloud application management and batch computing technologies surveyed. While these ratings are inherently subjective, reflecting individual perceptions and experiences, they provide valuable insights into the developer community's views. The nature of our research is centred on investigating developer perceptions of these aspects, making the subjective nature of the ratings not only acceptable but also valuable for our analysis. Although the subjective nature of Likert scales may influence the interpretation of results, as different respondents may have varying standards for rating, this variability enriches our understanding of the developer experience.

Despite these nuances, analysing the distribution of ratings — such as the difference between the number of 5-star ratings and those of 1 and 2 stars — serves as a practical measure for understanding developer sentiments. This approach allows us to identify trends and patterns that can inform decision-making, highlighting areas of strength and opportunities for improvement within the surveyed technologies. Thus, we assert that Likert scales are an effective tool for gauging developer perceptions and experiences.

Respondent demographics

Respondents were initially asked about where their projects ran or were deployed, to identify their position as a 'cloud developer'. Following this, they were asked which technologies they were currently using, that we associate with cloud-native development approaches, including technologies such as Infrastructure as Code, service meshes, and serverless computing.

Respondents were recruited from a combination of third-party panels, and within CNCF's community. For privacy and data minimisation purposes, exclusion is based on internal consistency and survey-taking behaviour metrics. As such, information on the organisation the respondent works for is not carried through to any analysis. This privacy also helps encourage greater honesty from respondents, who do not have concerns that their expressed opinion will be associated with them.

Due to the nature of third-party panels making up the significant majority of respondents, we consider the risk of multiple respondents from the same organisation responding to be low, and as such do not engage in deduping cleanses. However, should more than one individual from the same organisation respond to the survey, we do not consider it to impact the validity of the results.

Within the same organisation, developers may be using different technologies. Further, while usage was used in the determination of each technology's position on the technology landscape radar, the developer's personal perceptions corresponded to 75% of the score the technology received.
